

IDEATION PHASE

Customer Support Ticket Priority Prediction and Automated Assignment System Using Agentforce

IDEATION PHASE

Introduction

The Ideation Phase focuses on identifying possible solutions for the problems experienced by customers, support agents, and support managers during the customer support process.

The main objective of this phase is to generate different ideas for improving **ticket prioritization, assignment, urgent issue handling, and SLA risk identification**.

For this project, the team studied the difficulties faced in manually analyzing support tickets and explored automation-based solutions using **Salesforce and Agentforce**.

Problem Identification

Customer support teams may receive a large number of support tickets every day. When tickets are manually reviewed and prioritized, urgent issues can sometimes be delayed or assigned incorrectly.

The major problems identified are:

- Manual ticket prioritization
- Difficulty identifying urgent issues
- Important keywords in ticket descriptions may be missed
- Delayed assignment of tickets
- Manual creation of tasks for critical tickets
- Large numbers of tickets increasing the workload of support agents

1. Problem Statement

PS-1 – Support Agent

I am:Support Agent

I'm trying to:Focus on critical tickets first

But:Tickets are not always prioritized automatically

Because:Ticket prioritization can be manual

Which makes me feel:Frustrated

PS-2 – Customer

I am:Customer

I'm trying to:Get urgent issues resolved quickly

But:Critical issues may wait behind lower-priority tickets

Because:Support teams handle large ticket volumes

Which makes me feel:Concerned

PS-3 – Support Manager

I am:Support Manager

I'm trying to:Assign tickets to the right support level

But:Assignment may require manual decisions

Because:Ticket urgency is not consistently analyzed

Which makes me feel:Overwhelmed

PS-4 – Support Agent

I am:Support Agent

I'm trying to:Identify urgent issues from descriptions

But:Important keywords can be missed

Because:Ticket descriptions contain different urgency signals

Which makes me feel:Uncertain

PS-5 – Support Manager

I am:Support Manager

I'm trying to:Reduce SLA-related risk

But:Older unresolved tickets may remain unnoticed

Because:SLA risk needs additional checking

Which makes me feel:Concerned These five problem statements are directly represented in the project source. Customer Support Ticket Priorit...

2. User Persona

Primary User: Support Agent

The main user persona considered during ideation is the **Support Agent**.

Needs:

- Quickly identify critical tickets
- Understand ticket priority
- Handle urgent issues first
- Reduce repetitive manual work
- Receive clear ticket information

Challenges:

- Large ticket volumes
- Manual prioritization
- Missed urgency signals
- Delayed assignment
- SLA-related concerns

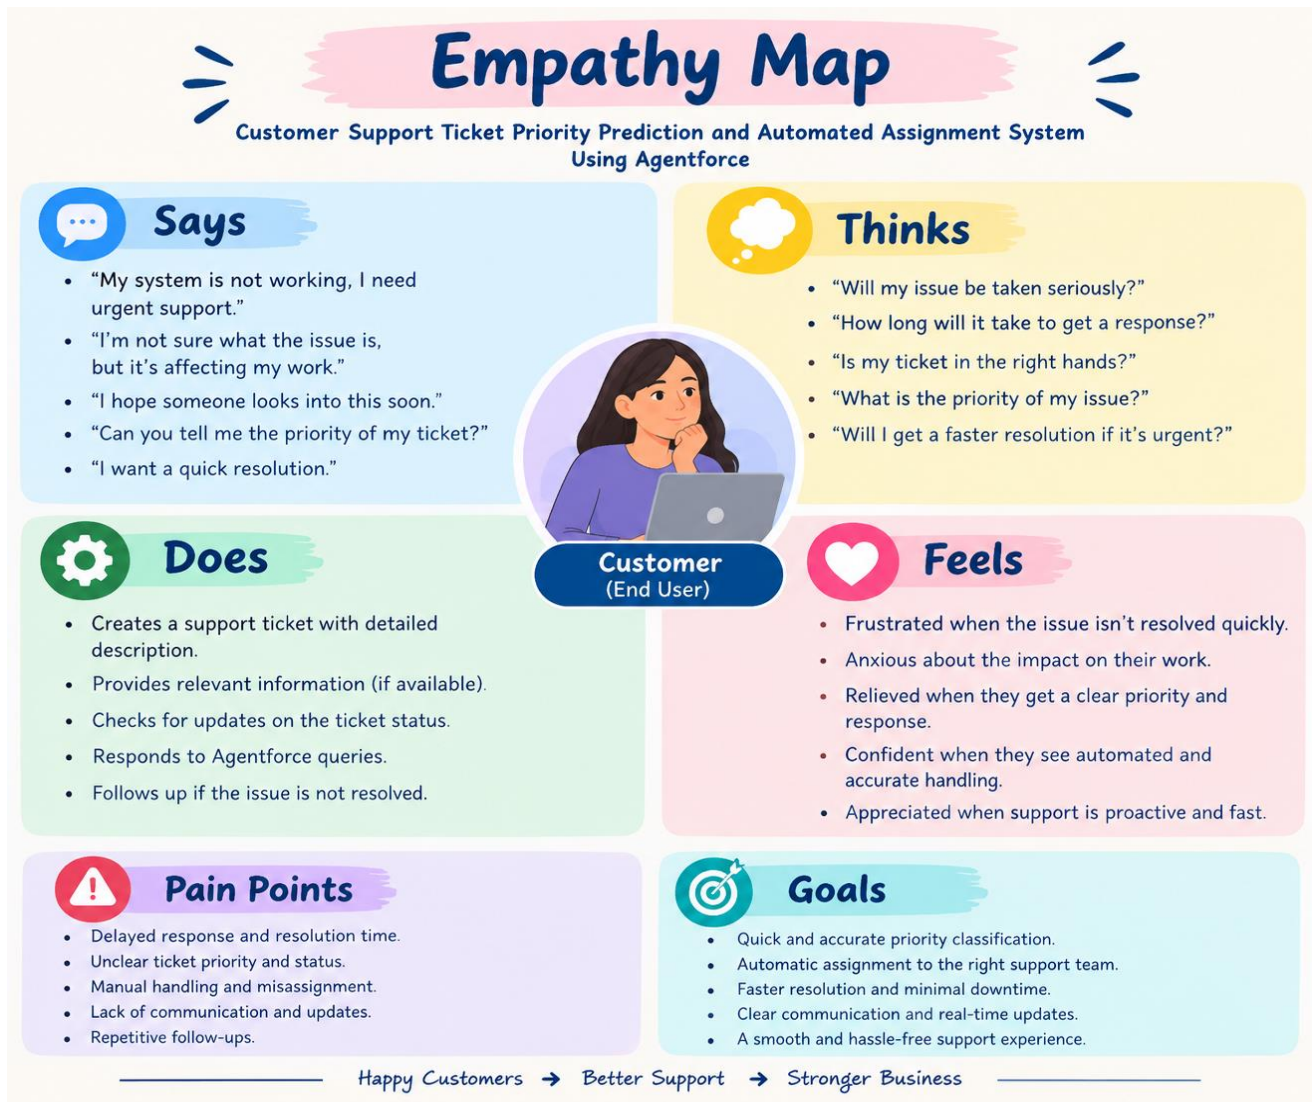

Expected Solution:

An automated system that analyzes ticket descriptions, determines priority, and assists with appropriate support handling.

3. Empathy Map

Think & Feel

- Wants critical issues to be identified quickly.
- Wants urgent customer problems to receive immediate attention.
- Feels concerned when important tickets are delayed.
- Wants less manual prioritization work.

4. Brainstorming

During brainstorming, the team considered multiple possible solutions.

Idea 1 – Manual Ticket Register

Maintain customer support tickets manually in a register.

Advantages:

- Simple to understand
- Easy to start

Limitations:

- Time-consuming
- Difficult to manage large ticket volumes
- No automatic priority detection
- Higher possibility of human error

Idea 2 – Spreadsheet-Based Ticket Tracking

Use Excel or spreadsheets to maintain support ticket information.

Advantages:

- Easy to create
- Low initial cost
- Familiar to users

Limitations:

- Manual data entry
- No intelligent ticket analysis
- Difficult to automate assignment
- Difficult to manage increasing ticket volumes

Idea 3 – Standalone Support Portal

Create a separate web-based customer support portal.

Advantages:

- Dedicated support interface
- Customers can submit tickets online
- Can provide ticket status

Limitations:

- Requires additional development
- Requires separate database/integration
- Does not naturally provide Salesforce automation

Idea 4 – Salesforce CRM with Agentforce

Use Salesforce to store customer and ticket information and use Agentforce for conversational ticket analysis.

Advantages:

- Salesforce Flow can automate backend processes
- Agentforce can provide AI-assisted interaction
- Ticket priority can be automatically classified
- High-priority tasks can be created automatically
- Support assignment can be automated
- Can scale with increasing ticket volumes

Limitation:

- Requires proper Salesforce configuration and Flow/Agentforce setup.

5. Idea Comparison

Solution	Automation	Priority Detection	Assignment	Scalability
Manual Register	Low	Manual	Manual	Low
Spreadsheet	Low	Manual	Manual	Medium
Standalone Portal	Medium	Limited	Possible	Medium
Salesforce + Agentforce	High	Automatic	Automatic	High

6. Final Idea Selected

After comparing the possible solutions, the team selected:

Salesforce CRM with Agentforce

The proposed system combines:

Salesforce CRM + Support Ticket Intelligence + Auto-Launched Flow + Agentforce

The solution analyzes customer support ticket descriptions and automatically determines whether a ticket is:

- **High Priority**
- **Medium Priority**
- **Low Priority**

For high-priority tickets, the system can create an urgent handling task and assign the case to the appropriate support level.

The project source identifies Salesforce CRM with Agentforce as the final selection because of its automation, AI-assisted ticket analysis, automatic priority classification, urgent-task creation, and reduced manual support effort. Customer Support Ticket Priorit...

7. Proposed Innovation

The main innovation of the project is the combination of **Agentforce AI-assisted interaction with Salesforce Flow automation**.

Traditional Process

Customer Ticket → Manual Review → Manual Priority → Manual Assignment → Manual Task Creation

Proposed Process

Customer Ticket → Agentforce → Ticket Analysis → Priority Classification → Automated Assignment → Urgent Task → Response This reduces the amount of manual work required from support teams.

8. Priority Classification Idea

The system classifies tickets into three priority levels.

Priority	Example Indicators	Action
High	Urgent, Not Working, Failure	Immediate attention / urgent task
Medium	Issue, Slow, Delay	Normal support handling
Low	No high/medium indicators	Queue for processing

This provides a simple and consistent mechanism for identifying ticket urgency.

9. Expected Benefits

The selected idea is expected to provide:

1. Faster identification of urgent tickets
2. Reduced manual prioritization
3. Automatic handling of high-priority cases
4. Consistent support assignment
5. Improved customer support experience

10. Final Ideation Outcome

The ideation process resulted in the selection of a **Salesforce-based Customer Support Ticket Priority Prediction and Automated Assignment System Using Agentforce**.

The final concept uses **Agentforce** for conversational ticket analysis and **Salesforce Auto-Launched Flow** for backend automation. The system retrieves the latest support ticket, analyzes its description, determines the priority level, and performs appropriate support actions.
