

PROJECT DESIGN PHASE

Customer Support Ticket Priority Prediction and Automated Assignment System Using Agentforce

PROJECT DESIGN PHASE

The Project Design Phase defines how the proposed Salesforce and Agentforce solution addresses the support-ticket prioritization and assignment problem.

1.1 Problem–Solution Fit

Problem	Solution	Benefit
Manual ticket prioritization	Flow analyzes description and sets priority	Faster identification of urgent cases
Urgent issues may be missed	High-priority keyword decision	Critical cases receive attention
Manual task creation	Flow creates Task for High priority	Reduced manual effort
Manual support assignment	Flow sets assigned support level	More consistent handling
SLA risk can be overlooked	Optional SLA Risk decision	Better risk awareness
Need for conversational access	Agentforce subagent	AI-assisted interaction

1.2 Proposed Solution

Parameter	Description
Problem	Manual ticket prioritization and assignment causing delays in handling critical customer support issues.
Solution	Salesforce-based Customer Support Ticket Priority Prediction and Automated Assignment System.
Innovation	Agentforce AI + Auto-Launched Flow for analyzing ticket descriptions, automatically classifying priority, assigning support level, and triggering urgent-task automation.

Impact	Faster identification of critical tickets, reduced manual effort, improved response time, and better support-team productivity.
Business Model	Customer support operations involving customers, support agents, support managers, and AI-assisted ticket handling.
Scalability	Supports increasing support-ticket volumes through Salesforce automation, with scope for additional assignment rules, SLA monitoring, and priority indicators.

1.3 Solution Architecture

Users / Support Team → Agentforce → Support Ticket Priority Analysis → Auto-Launched Flow → Account & Ticket Data → Description Analysis → Priority Decision → Task / Assignment → Final Message → Agentforce Response

2. DETAILED PROJECT FLOW

The flow below follows the documented implementation of the Support Ticket Intelligence solution.

- 1. User Input:** User provides the customer Account Name through Agentforce.
- 2. Agentforce Action:** Agentforce invokes the Support Ticket Priority Analysis action.
- 3. Get Account:** The Auto-Launched Flow finds the Account using the provided Account Name.
- 4. Store Account ID:** The Account Id is stored in varAccountId.
- 5. Get Ticket:** The Flow retrieves the latest Support Ticket Intelligence record for the Account.
- 6. Store Ticket ID:** The ticket Id is stored in varTicketId.
- 7. Analyze Description:** The ticket description is checked for configured High, Medium, and Low priority conditions.
- 8. Set Priority Level:** The Flow sets varPriorityLevel to High, Medium, or Low.
- 9. High Priority Check:** The Flow checks whether varPriorityLevel equals High.
- 10. Create Urgent Task:** For High priority, an Urgent Ticket Handling Task is created with High priority and Not Started status.
- 11. Set Assigned Agent:** The Flow sets the assigned support level as Senior Support Agent for the High-priority path.
- 12. Optional SLA Risk:** The documented design includes an optional SLA-risk check for older unresolved tickets.
- 13. Final Message:** The Flow prepares the final message for Agentforce.
- 14. Agentforce Response:** Agentforce displays the priority and handling result to the user.

3. PRIORITY DECISION FLOW

Priority	Configured description conditions	Action / Output
HIGH	Description contains urgent, not working, or failure	Set High → Create Urgent Ticket Handling Task → Senior Support Agent → High-priority final message
MEDIUM	Description contains issue, slow, or delay	Set Medium → Medium-priority final message
LOW	No configured High or Medium keyword condition matches	Set Low → Low-priority final message

4. FLOW ELEMENTS

Order	Element	Purpose
1	Get Account	Find Account using varAccountName.
2	Assignment – Store Account Id	Set varAccountId = Get_Account.Id.
3	Get Ticket	Get latest Support_Ticket_Intelligence_c record for the Account.
4	Assignment – Store Ticket Id	Set varTicketId = Get_Ticket.Id.
5	Decision – Analyze Description	Choose High, Medium, or Low path from ticket description.
6	Assignment – Set Priority Level	Set varPriorityLevel.
7	Decision – High Priority Check	Check varPriorityLevel Equals High.
8	Create Records – Urgent Ticket Handling	Create Task only for High priority.
9	Assignment – Set Assigned Agent	Set varAssignedTo = Senior Support Agent.
10	Optional SLA Risk	Check older unresolved tickets for potential SLA risk.
11	Assignment – Set Final Message	Prepare the response returned to Agentforce.

5. END-TO-END FLOW SUMMARY

Account Name Input → Agentforce → Support Ticket Priority Analysis → Auto-Launched Flow → Get Account → Get Latest Ticket → Analyze Description → Set Priority → High Priority Check → Create Urgent Task if High → Assign Senior Support Agent → Set Final Message → Agentforce Response

6. FINAL OUTCOME

The documented design connects Agentforce with Salesforce Flow so that a support request can be analyzed, classified as High, Medium, or Low, and handled through configured automation. High-priority tickets trigger an urgent handling task and are assigned to the Senior Support Agent support level. The final result is returned through Agentforce.
