

PROJECT DEVELOPMENT PHASE

Customer Support Ticket Priority Prediction and Automated Assignment System Using Agentforce

1. Project Development Overview

The project is developed in Salesforce using Salesforce Flow and Agentforce. The main purpose is to process customer support tickets, identify their priority, and automate the assignment or follow-up action for the support team.

2. Salesforce Account Setup

- Open the Salesforce account and access the Salesforce setup environment.
- Use the Object Manager to create and configure the required project object.
- Prepare the Salesforce environment for creating the Support Ticket solution.

Build for the Agentic Enterprise. Sign up for your Developer Edition.

The entire Salesforce platform - exposed as APIs, MCP tools, and CLI commands. Build apps, ship agents, and let coding agents do the heavy lifting with Salesforce Headless 360.

- ✓ Build AI agents with Agentforce, grounded in your data with Data 360
- ✓ Connect Claude Code, Cursor, or Codex to your org with hosted MCP
- ✓ Build in the browser with the Agentforce Vibes IDE - no setup required
- ✓ Drag-and-drop when you want it, Apex when you need it
- ✓ 60+ MCP tools and 30+ coding skills, ready out of the box

3. Creating the Support Ticket Object

A custom object named Support Ticket is created to store customer support requests. This object acts as the main record used by the automation.

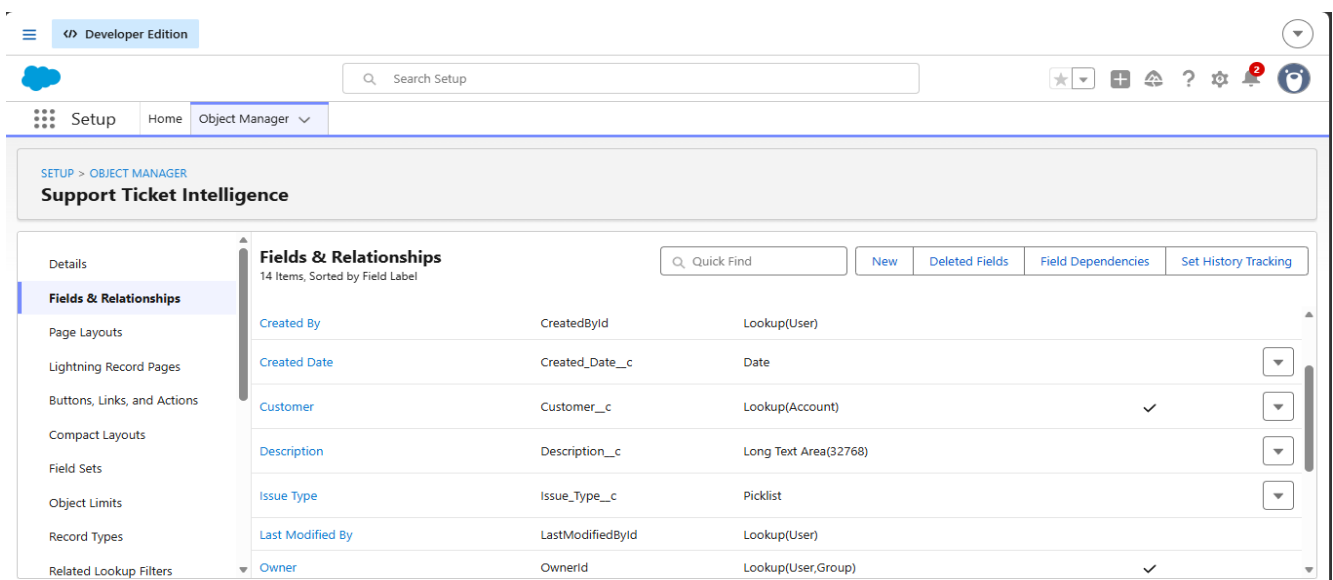

- Create the Support Ticket custom object.

- Add the required fields for ticket information.
- Include the ticket description and priority information.
- Create the required relationship with the Contact object so a ticket can be connected to the customer.
- Create a Support Ticket tab so users can easily access the records.

4. Creating a Sample Support Ticket

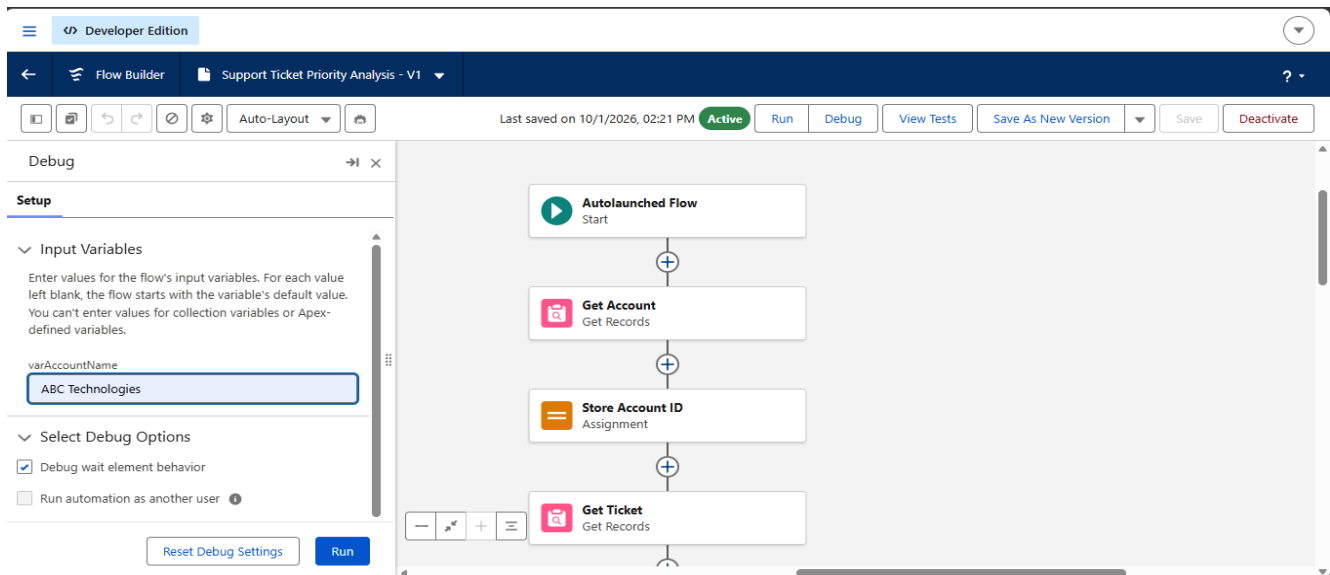

A sample Support Ticket record is created to test the solution. Customer information and the issue description are entered into the ticket.

5. Creating the Salesforce Flow

An Auto-Launched Flow is created to automate the support ticket priority process. The flow receives the ticket information, checks the description, determines the priority, and performs the required update or action.

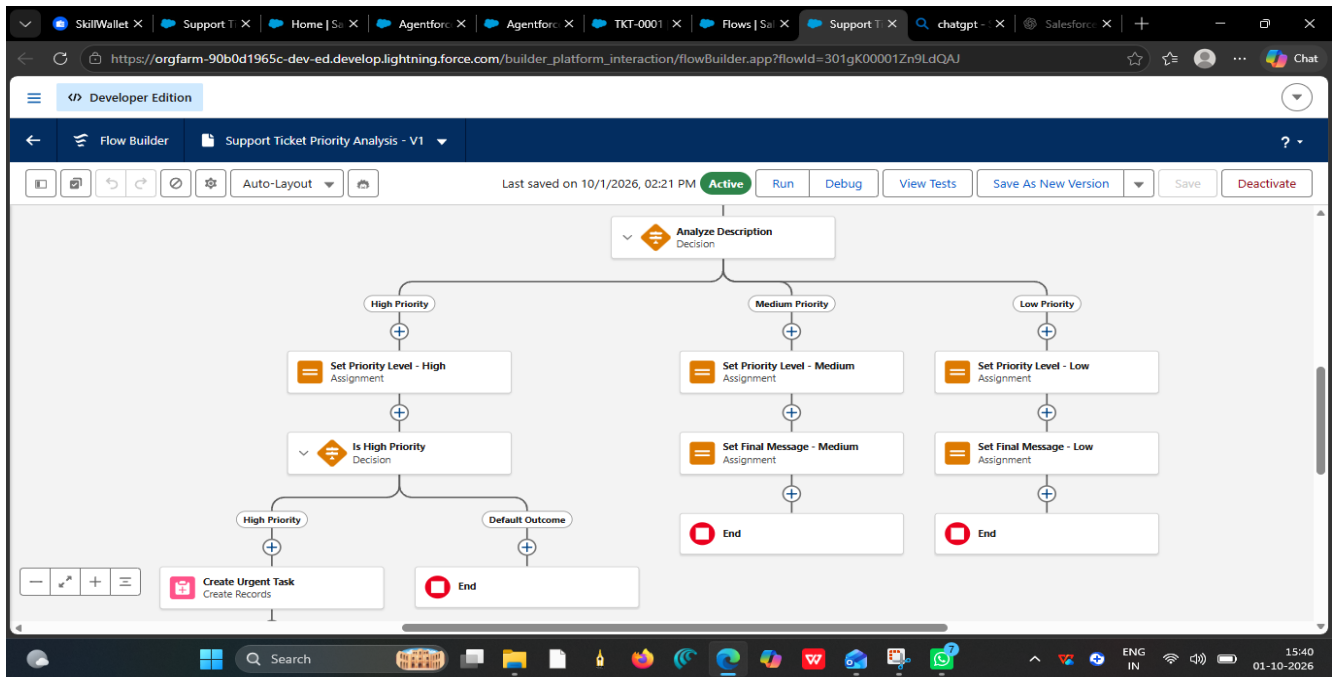

- Open Salesforce Flow Builder.
- Create an Auto-Launched Flow.
- Name the flow Support Ticket Priority Analysis.
- Configure the Start element.
- Use Get Records to retrieve the required Account information.
- Retrieve the Support Ticket record that needs to be processed.

6. Ticket Priority Analysis

A Decision element is used to analyze the support ticket and select the appropriate priority path.

- Create a Decision element named Analyze Description.
- Create a High Priority path.
- Create a Medium Priority path.
- Create a Low Priority path.
- Use the ticket description and the configured conditions to select the correct path.

7. High Priority Processing

When a ticket is identified as High Priority, the flow updates the ticket with the required priority value and continues with the actions configured for urgent support requests.

- Select the High Priority branch.
- Set the ticket priority to High.
- Configure the required follow-up action.
- Assign the ticket or create the required support task according to the configured flow.

8. Medium and Low Priority Processing

The same flow handles Medium and Low Priority tickets. This provides a consistent process for different types of customer support requests.

- For Medium Priority, update the ticket priority to Medium.
- For Low Priority, update the ticket priority to Low.
- Connect each branch to the appropriate next action and end the flow correctly.

9. Automated Assignment

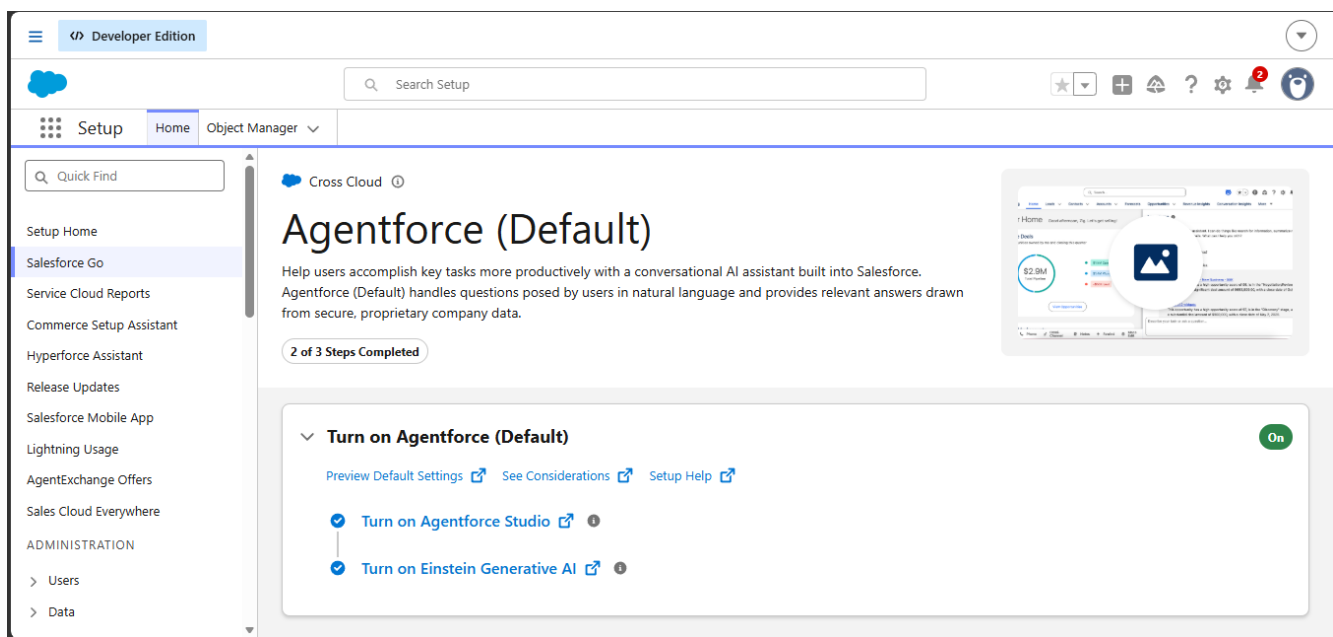

The assignment stage is used to route the support ticket to the appropriate support user or agent. This reduces the need for manual assignment after the priority is identified.

- Configure the assignment action in the required priority branch.
- Select the appropriate Salesforce user or agent for the ticket.
- Save the configured action and connect it to the flow.

10. Connecting the Solution with Agentforce

Agentforce is connected to the Salesforce automation so that the agent can work with the support ticket process. Agentforce handles the interaction while Salesforce Flow performs the configured business logic.

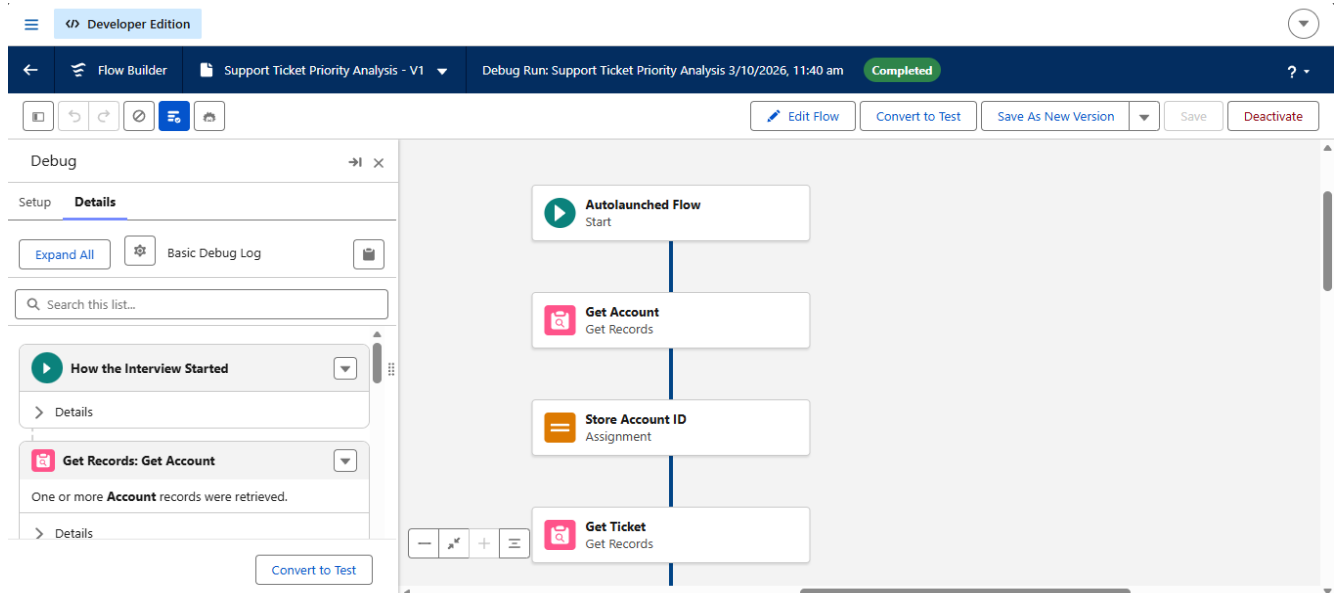

- Open Agentforce Builder.
- Configure the required Agent Action.
- Connect the action to the Support Ticket Priority Analysis flow.
- Configure the required inputs and outputs.
- Save the Agent Action configuration.

11. Testing the Project

The completed solution is tested using sample support ticket information. The ticket description is provided and the system processes it through the configured flow.

- Create or select a sample Support Ticket.
- Provide the customer issue description.
- Run the configured automation.
- Check whether the correct priority is selected.
- Verify that the ticket is updated correctly.
- Verify the configured assignment or follow-up action.
- Test High, Medium, and Low Priority scenarios.
-

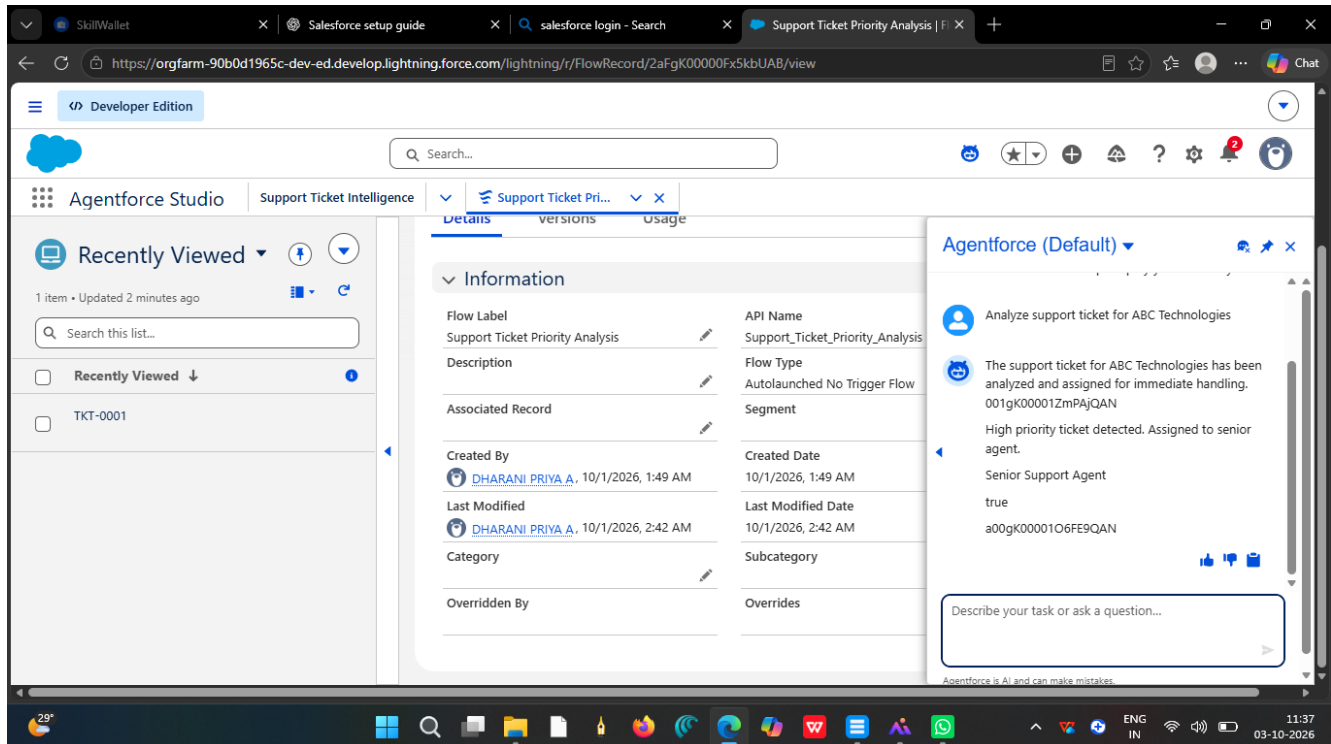

12. Final Working Flow

The overall development flow is: Customer Support Request → Support Ticket → Ticket Description Analysis → Priority Decision → High/Medium/Low Path → Ticket Update → Automated Assignment/Action → Support Team.

13. Development Result

The developed system provides an automated way to process customer support tickets. It reduces manual priority checking, supports consistent ticket handling, and helps route tickets to the appropriate support user or action. Agentforce provides the intelligent interaction layer, while Salesforce Flow performs the configured automation.

14. Conclusion

The project development phase successfully combines a custom Support Ticket object, Salesforce Flow, and Agentforce to create a customer support ticket priority and automated assignment solution. The system is designed to make support ticket handling faster, more consistent, and easier for the support team.
